

Oracle Fusion Implementation life Cycle

Phase 1: Planning and Scoping

Phase 2: Configuration and Setup

Phase 3: Data Migration and Integration

Phase 4: Testing

Phase 5: Training and Deployment

Phase 6: Post-Implementation Support and Optimization

To be defined
Financial Module
Wise

Same for All the
Module

Common for All Module Implementations.

Phase 4: Testing

- **Unit Testing:**
 - Individual team members test their configured setups to ensure they function correctly in isolation.
- **System Integration Testing (SIT):**
 - Test the end-to-end business processes, including integrations with other modules (e.g., Procurement to Payables). This ensures that data flows correctly between different parts of the system.
- **User Acceptance Testing (UAT):**
 - Business users validate the configured processes against the documented requirements. This is a crucial step to ensure the solution is accepted by the end-users. UAT should be performed using real-world business scenarios and data.

Phase 5: Training and Deployment

This phase prepares the organization for the new system and manages the transition to the production environment.

- **Training and User Enablement:**
 - Develop training materials and conduct training sessions for all end-users. The training should be role-based and cover the new processes and system functionalities.
- **Go-Live Preparation:**
 - Finalize data migration to the production environment.

- Perform a last-minute sanity check of the system.
- Set up a hyper-care support team for the initial period after go-live.
- **Go-Live:**
 - Cut over from the old system to Oracle Fusion Procurement.
 - Provide immediate support to users as they begin using the new system.

Phase 6: Post-Implementation Support and Optimization

- **Post-Go-Live Support (Hyper-Care):**
 - Provide dedicated support to address any issues or questions that arise in the initial days and weeks after go-live.
- **Continuous Improvement:**
 - Gather feedback from users and identify opportunities for optimization.
 - Plan for future enhancements and new feature releases.
- **Ongoing Maintenance:**
 - Establish a support model for ongoing system maintenance, including managing quarterly updates from Oracle, user provisioning, and issue resolution.

Documents to be Prepared while implementation:

Phase 1: Planning and Scoping

- Project Charter
- Business Requirements Document (BRD)
- Solution Design Document (SDD) / High-Level Design (HLD)
- Project Plan

Phase 2: Configuration and Setup

- Configuration Workbook
- Functional Design Document (FDD)
- Technical Design Document (TDD)

Phase 3: Data Migration and Integration

- Data Conversion Strategy / Data Migration Plan
- Data Mapping Document
- Integration Design Document

Phase. 4. Testing

- Test Strategy / Test Plan
- Test Scripts / Test Cases
- User Acceptance Testing (UAT) Sign-off Document

Phase.5. Training and Deployment

- Training Plan
- Training Materials
- Cutover Plan

Phase 6: Post-Implementation Support and Optimization

- Support Model Document
- System Administration Guide
- Lessons Learned Document

Detailed: Document Meaning

Phase 1: Planning and Scoping

- **Project Charter:** A formal, high-level document that outlines the project's purpose, objectives, scope, stakeholders, and high-level timeline. It gets signed off by the executive sponsor.
- **Business Requirements Document (BRD):** This document details the functional and non-functional requirements of the business. It captures the "as-is" processes, identifies pain points, and outlines the desired "to-be" processes. It's often broken down by module (e.g., GL BRD, Procurement BRD).
- **Solution Design Document (SDD) / High-Level Design (HLD):** This is the blueprint for the entire solution. It translates the business requirements into a technical design. It includes:
 - System architecture overview.
 - Module-specific designs (e.g., Chart of Accounts design, workflow rules).
 - Integration strategy.
 - Data migration strategy.
 - Reporting and analytics strategy.
- **Project Plan:** A detailed plan that includes tasks, milestones, resource assignments, and a timeline for all project activities.
- **Risk and Issue Log:** A living document used to track potential risks to the project and any issues that arise, along with their mitigation or resolution plans.

Phase 2: Configuration and Setup

- **Configuration Workbook:** This is a key implementation document. It's typically a spreadsheet-based workbook that records all the configuration settings made in the system. It's used to:
 - Document the setup of enterprise structures (Legal Entities, Business Units).
 - Record the setup of master data (e.g., supplier profiles, item master).
 - List all the values for lookups, DFFs (Descriptive Flexfields), and key configurations.
 - Often, the configuration is broken down into separate workbooks for each module (e.g., GL Configuration Workbook, Accounts Payable Configuration Workbook).
- **Design Documents (for extensions):** If custom reports, integrations, or workflows (extensions) are required, separate design documents are created:
 - **Functional Design Document (FDD):** Details the business logic and functional requirements of the custom component.
 - **Technical Design Document (TDD):** Describes the technical specifications, including the tables, APIs, and code logic for the custom component.

Phase 3: Data Migration and Integration

- **Data Conversion Strategy / Data Migration Plan:** Outlines the approach for migrating data from legacy systems to Oracle Fusion. It defines the scope of data to be migrated

(e.g., master data, open transactions), the migration tools (e.g., FBDI, ADFdi), and the cleansing and validation process.

- **Data Mapping Document:** A detailed spreadsheet that maps fields from the source system to the target fields in Oracle Fusion. This is crucial for the technical team building the data conversion programs.
- **Integration Design Document:** Describes the design of each integration point, including the data formats, security, and frequency of data exchange.

Phase 4: Testing

- **Test Strategy / Test Plan:** Defines the overall testing approach for the project, including the different types of testing to be performed (Unit, SIT, UAT), the test environments, and the roles and responsibilities.
- **Test Scripts / Test Cases:** Detailed step-by-step instructions for testers to follow. Each script includes a test scenario, the expected result, and a space to record the actual result.
- **User Acceptance Testing (UAT) Sign-off Document:** A formal document signed by key business users or stakeholders to confirm that they have tested the system and accept it as meeting the business requirements.

Phase 5: Training and Deployment

- **Training Plan:** A schedule and curriculum for training end-users, specifying who needs to be trained, on what topics, and when.
- **Training Materials:** Includes user manuals, process guides, presentation decks, and quick reference cards. These are often role-based to provide specific instructions for each user group.
- **Cutover Plan:** A detailed, minute-by-minute plan for the go-live weekend. It outlines all the steps required to transition from the old system to the new one, including data migration, system shutdown, and final validations.

Phase 6: Post-Implementation Support and Optimization

- **Support Model Document:** Defines the post-go-live support structure, including who to contact for issues, the escalation process, and roles for managing the system (e.g., administrators, help desk).
- **System Administration Guide:** A technical document for administrators on how to manage the system, including user security, new user provisioning, and running maintenance jobs.
- **Lessons Learned Document:** A summary of what went well, what could be improved, and key recommendations for future projects. This is a critical document for continuous improvement.

General Ledger

Phase 1: Planning and Scoping

This phase lays the groundwork for the entire project. It's where you define the business requirements, design the future state, and plan the project's execution.

- **Project Kick-off and Team Formation:**
 - **Project Charter:** Create a document that defines the project's objectives, scope, timeline, and key stakeholders.
 - **Team:** Assemble the implementation team, which should include:
 - **Project Manager:** To oversee the project plan, resources, and communication.
 - **Functional Consultants:** GL and other financials module experts.
 - **Technical Consultants:** For data migration, integration, and reporting.
 - **Business Subject Matter Experts (SMEs):** From the finance and accounting departments who understand the current processes.
- **Business Requirements Gathering:**
 - **"As-Is" Analysis:** Document the current accounting and reporting processes. This includes understanding the existing chart of accounts, accounting calendars, and financial reports.
 - **"To-Be" Process Design:** Design the new processes in Oracle Fusion GL, leveraging standard functionalities and best practices.
 - **Chart of Accounts (COA) Design:** This is arguably the most critical step. The COA is the foundation of the financial structure.
 - **Analyze Reporting Needs:** What financial statements (income statement, balance sheet) and management reports are required?
 - **Define Segments:** Determine the segments of the COA (e.g., Company, Department, Account, Intercompany). A good COA design is flexible, scalable, and meets all reporting needs.
 - **Value Sets:** Define the value sets for each segment and their validation types (e.g., independent, dependent).
- **Solution Design Document (SDD):**
 - Create a comprehensive document that outlines the final design of the GL solution, including the COA structure, ledger setup, and reporting requirements.

Phase 2: Configuration and Setup

This phase involves configuring the GL module in Oracle Fusion using the Functional Setup Manager (FSM).

- **Enterprise Structures:**
 - **Enterprise:** The highest level of the organizational hierarchy.
 - **Legal Entities:** Define the legal entities that will be responsible for statutory and tax reporting.
 - **Business Units:** Define Business Units to manage business functions, such as processing transactions.
- **Chart of Accounts (COA) Configuration:**

- **Manage Chart of Accounts Structures:** Create the COA structure based on the design from Phase 1.
- **Manage Value Sets:** Define the value sets for each segment, including the values and their hierarchies.
- **Manage Account Hierarchies:** Build and maintain hierarchies (trees) for segments like Company and Account. These hierarchies are crucial for reporting and security.
- **Deploy Flexfield:** After all segments and value sets are defined, the COA structure must be deployed to be used by the system.
- **Ledger Configuration:**
 - **Primary Ledger:** This is the main ledger that records all financial transactions. The primary ledger is a combination of four components:
 - **Chart of Accounts:** The COA you just created.
 - **Accounting Calendar:** Define the accounting periods (e.g., monthly, quarterly).
 - **Currency:** The functional currency of the ledger.
 - **Accounting Method:** The accounting standard (e.g., U.S. GAAP, IFRS).
 - **Secondary Ledgers (Optional):** If needed, configure secondary ledgers to maintain an alternate accounting representation for specific legal or reporting requirements.
 - **Data Access Sets (DAS):** Create DAS to control which ledgers and balancing segment values a user can access, ensuring data security.
- **Other Key GL Configurations:**
 - **Journal Setup:**
 - **Journal Sources and Categories:** Define sources (e.g., Payables, Receivables) and categories (e.g., Purchase Invoice, Sales Invoice) for journals.
 - **Journal Approval Rules:** Configure the approval workflow for journal entries.
 - **AutoPost Criteria Sets:** Define rules to automatically post journals that meet specific criteria.
 - **Intercompany Setup:**
 - **Intercompany System Options:** Configure rules for automatic intercompany balancing.
 - **Intercompany Balancing Rules:** Set up rules to automatically generate intercompany balancing segments for cross-company transactions.
 - **Revaluation and Translation:**
 - **Manage Revaluation:** Configure how foreign currency balances are revalued.
 - **Manage Translation:** Configure how ledger balances are translated for consolidation purposes.

Phase 3: Data Migration and Integration

This phase is about populating the new system with data and ensuring it can communicate with other applications.

- **Master Data Migration:**
 - Use tools like **File-Based Data Import (FBDI)** and **ADF Desktop Integrator (ADFdi)** to load master data, such as:
 - Chart of accounts segment values (if not using the rapid implementation spreadsheet).
 - Journal entry batches.
 - **Rapid Implementation Spreadsheet:** For a quick start, this spreadsheet allows you to define enterprise structures, COA, ledgers, and legal entities in a single file and upload it.

- **System Integration:**
 - **Subledger Integration:** Verify that subledgers (e.g., Accounts Payable, Accounts Receivable) are properly configured to send accounting data to the GL via **Subledger Accounting (SLA)**.
 - **External System Integration:** Use **Oracle Integration Cloud (OIC)** or other integration tools to connect the GL with external systems for data exchange.

Payables

Phase 1: Planning and Scoping

- **Project Kick-off and Team Formation:**
 - **Project Charter:** Establish a formal document outlining project goals, scope, and key stakeholders.
 - **Team:** Form a cross-functional team including a Project Manager, Payables functional and technical consultants, and business subject matter experts (SMEs) from the Accounts Payable department.
- **Requirements Gathering and Business Process Analysis:**
 - **"As-Is" Analysis:** Document the current invoice processing and payment methods. This includes understanding manual invoice entry, approval workflows, and how payments are made and reconciled.
 - **"To-Be" Process Design:** Design the future state business processes leveraging Oracle Fusion Payables' capabilities. This includes defining the flow from invoice receipt (e.g., email, supplier portal) to final payment and accounting.
 - **Integration Points:** Identify and document key integration points with other modules, especially Procurement (for Purchase Order matching), General Ledger (for accounting), and Cash Management (for bank reconciliation).
- **Solution Design Document (SDD):**
 - Create a detailed blueprint of the Payables solution. This document will cover the design of invoice processing rules, payment formats, bank account setup, and reporting requirements.

Phase 2: Configuration and Setup

- **Enterprise Structures:**
 - Ensure the foundational enterprise structures (Legal Entities, Business Units, Ledgers) are already set up as part of the General Ledger implementation.
- **Common Payables and Procurement Configurations:**
 - **Common Options:** Configure common options for Payables and Procurement, such as payment terms, freight terms, and bill of lading types.
 - **Lookups and Flexfields:** Set up and enable any necessary custom lookups or Descriptive Flexfields (DFFs) to capture additional information on invoices or payments.
- **Payables Specific Configurations:**

- **Payables Options:** Configure core Payables options at the Business Unit level. This includes:
 - **Invoice Options:** Invoice type defaults, payment options, and tax handling.
 - **Payment Options:** Payment processing methods, payment request defaults, and payment file formats.
- **Invoice Configuration:**
 - **Invoice Holds and Releases:** Define the types of holds (e.g., quantity variance, price variance) and their corresponding release rules.
 - **Distribution Sets:** Configure distribution sets for recurring non-PO invoices to automate the creation of accounting distributions.
 - **Payables Approval Workflow:** Design and configure the approval workflow for invoices based on business rules (e.g., by amount, by supplier, by expense category).
- **Payments Configuration:**
 - **Payment Process Profile:** This is a crucial setup that defines how payments are generated. It links payment methods, payment formats (e.g., ACH, wire transfer), and bank accounts.
 - **Payment Method:** Define the methods of payment used by the organization (e.g., Check, ACH, Wire).
 - **Payment Format:** Configure the layout and content of the payment file that will be sent to the bank. This often requires working with the bank to get their specific file format specifications.
 - **Bank and Bank Account Setup:** Define the company's banks and bank accounts, and link them to the Cash Management module for reconciliation.
- **Supplier Configuration:**
 - **Supplier Profile:** Configure supplier attributes, address types, and the approval workflow for new supplier requests.
 - **Supplier Sites:** Define supplier sites and their payment options.
 - **Supplier Bank Accounts:** Configure supplier bank accounts for electronic payments.

Phase 3: Data Migration and Integration

- **Data Migration Strategy:**
 - **Master Data:** Plan the migration of supplier data, including supplier profiles, addresses, and bank accounts.
 - **Open Transaction Data:** Decide whether to migrate open invoices and unapplied payments. This requires careful planning and coordination to avoid double-entry.
- **Data Migration Tools:**
 - Use **File-Based Data Import (FBDI)** templates for bulk loading of suppliers and invoices.
 - Use **ADF Desktop Integrator (ADFdi)** for creating journal entries for cutover balances.
- **System Integration:**

- **Procurement:** Ensure the integration with Oracle Fusion Procurement for invoice matching is working correctly. This is essential for the Procure-to-Pay flow.
- **General Ledger:** Verify the integration with GL through Subledger Accounting (SLA). Payables transactions are sent to SLA, which creates the final accounting entries that are posted to the GL.
- **Cash Management:** Confirm that the integration with Cash Management is set up for bank statement reconciliation.
- **External Systems:** If required, integrate with external systems for payment processing or tax calculation.

Receivables

Phase 1: Planning and Scoping

- **Project Kick-off and Team Formation:**
 - **Project Charter:** Create a document that defines the project's goals, scope, timeline, and key stakeholders, including the executive sponsor and project manager.
 - **Team:** Assemble a cross-functional team with a strong understanding of the business. This includes Receivables functional and technical consultants, and business Subject Matter Experts (SMEs) from the Accounts Receivable department, Sales, and Credit and Collections.
- **Requirements Gathering and Business Process Analysis:**
 - **"As-Is" Analysis:** Document the current invoicing, cash application, and collections processes. Understand how invoices are generated, how payments are received and applied, and how collections are managed.
 - **"To-Be" Process Design:** Design the future state business processes in Oracle Fusion Receivables, leveraging standard functionality and best practices. This includes defining the flow from sales order or billing to invoice creation, payment processing, and final revenue recognition.
 - **Integration Points:** Identify and document key integration points, especially with Sales and Order Management (for invoice creation), General Ledger (for accounting), and Cash Management (for bank reconciliation).
- **Solution Design Document (SDD):**
 - Create a detailed blueprint of the Receivables solution. This document will cover the design of invoice and receipt classes, revenue recognition rules, and reporting requirements.

Phase 2: Configuration and Setup

- **Enterprise Structures:**
 - Ensure the foundational enterprise structures (Legal Entities, Business Units, Ledgers) are already set up as part of the General Ledger implementation.
- **Receivables Specific Configurations:**

- **Receivables System Options:** Configure core Receivables options at the Business Unit level. This includes:
 - **Customer and Bill-to settings:** Defaults for customer creation.
 - **Invoice settings:** Automatic invoice numbering, grouping rules, and transaction types.
 - **Payment settings:** Receipt numbering and cash receipt accounts.
- **Transaction Configuration:**
 - **Transaction Types:** Define different types of invoices (e.g., standard invoice, credit memo, debit memo).
 - **Transaction Sources:** Configure sources for transactions, such as manual entry, billing systems, or external applications.
 - **AutoInvoice:** This is a key feature for implementing Receivables. Configure AutoInvoice to import and validate invoices from external systems. Define the grouping rules to ensure lines are grouped correctly into invoices.
- **Receipts and Payments:**
 - **Receipt Class and Method:** Define the types of receipts (e.g., manual, lockbox, electronic) and their corresponding payment methods.
 - **Automatic Receipts and Remittances:** Configure rules for automatically generating and applying receipts from bank files (e.g., lockbox).
 - **Lockbox Processing:** Set up lockbox to automatically process bank files containing customer payments.
- **Revenue Recognition:**
 - **Revenue Contingencies:** Configure rules for recognizing revenue based on events, such as customer acceptance.
 - **Revenue Scheduling Rules:** Define rules for how revenue is recognized over time (e.g., in equal installments, on a specific date).
- **Collections:**
 - **Collections Setup:** Configure collections settings, including collections scoring, strategies, and dunning letters.
 - **Dunning Letters:** Design and configure dunning letter formats and send methods.
- **Customer Setup:**
 - **Customer Profile Classes:** Define customer profile classes to group customers with similar credit, collections, and reporting requirements.
 - **Customer and Site Creation:** Plan for the creation of customers and their associated sites (e.g., bill-to, ship-to).

Phase 3: Data Migration and Integration

- **Data Migration Strategy:**
 - **Master Data:** Plan the migration of customer data, including customer profiles, addresses, and credit information.
 - **Open Transaction Data:** Decide whether to migrate open invoices and unapplied receipts. This is a critical cutover decision that requires careful planning.
- **Data Migration Tools:**

- Use **File-Based Data Import (FBDI)** templates for bulk loading of customers, invoices, and receipts.
- Use **ADF Desktop Integrator (ADFdi)** for creating journal entries for cutover balances.
- **System Integration:**
 - **Order Management/Billing:** The most common integration point is with a billing or order management system that feeds invoices to Receivables via AutoInvoice.
 - **General Ledger:** Verify the integration with GL through Subledger Accounting (SLA). Receivables transactions are sent to SLA, which creates the final accounting entries that are posted to the GL.
 - **Cash Management:** Confirm that the integration with Cash Management is set up for bank statement reconciliation.

Fixed Assets

Phase 1: Planning and Scoping

- **Project Kick-off and Team Formation:**
 - **Project Charter:** Establish a formal document outlining project goals, scope, and key stakeholders.
 - **Team:** Form a team including a Project Manager, Fixed Assets functional consultants, and business Subject Matter Experts (SMEs) from the accounting and finance departments.
- **Requirements Gathering and Business Process Analysis:**
 - **"As-Is" Analysis:** Document the current process for managing fixed assets, including how assets are acquired, depreciated, and disposed of. This includes understanding the existing asset categories, depreciation rules, and reporting requirements.
 - **"To-Be" Process Design:** Design the future state business processes in Oracle Fusion Fixed Assets. This will involve defining how asset information will flow from procurement or projects into Fixed Assets and how depreciation will be calculated and posted to the General Ledger.
- **Solution Design Document (SDD):**
 - Create a detailed blueprint of the Fixed Assets solution. This document will cover the design of asset categories, depreciation books, and integration points.

Phase 2: Configuration and Setup

- **Enterprise Structures:**

- Ensure the foundational enterprise structures (Ledgers, Legal Entities) are already configured from the General Ledger implementation.
 - **Fixed Assets Specific Configurations:**
 - **Book Controls:** This is a crucial first step. A **depreciation book** is a set of asset records and financial rules. You'll set up:
 - **Corporate Book:** The primary book for financial reporting (e.g., for GAAP or IFRS).
 - **Tax Book:** If needed, a separate book for tax reporting that can have different depreciation rules.
 - **System Controls:** Define the fiscal year and accounting period for each depreciation book.
 - **Asset Calendars:** Create calendars for depreciation, prorate, and retirement. The **depreciation calendar** determines the periods for which depreciation is calculated. The **prorate calendar** defines the conventions for when depreciation starts.
 - **Asset Categories:** Set up asset categories (e.g., Computer Equipment, Office Furniture) and assign default values to them, such as:
 - **Depreciation Method:** The method used to calculate depreciation (e.g., straight-line, declining balance).
 - **Life:** The useful life of the asset in years.
 - **Prorate Convention:** The rule for when depreciation begins (e.g., full month, mid-month).
 - **Location and Employee Setup:**
 - Define asset locations to track where assets are physically located.
 - Link employees to assets for accountability.
 - **Mass Additions:** Configure the rules for loading assets from other modules, such as Procurement and Projects. This is a key part of the integration process.
-

Phase 3: Data Migration and Integration

- **Data Migration Strategy:**
 - **Master Data:** Plan the migration of existing assets, including asset descriptions, costs, accumulated depreciation, and asset location.
 - **Data Conversion:** Decide on the method for converting legacy asset data. This usually involves cleansing the data and preparing it for loading.
- **Data Migration Tools:**
 - Use **File-Based Data Import (FBDI)** templates for bulk loading assets and asset transactions. FBDI is the most common and efficient method for this.
 - Use **ADF Desktop Integrator (ADFdi)** for loading smaller sets of assets or transactions.
- **System Integration:**
 - **Procurement:** Configure the integration to bring asset-related purchase orders and invoices from Procurement into Fixed Assets as **Mass Additions**.

- **Projects:** Set up the integration with Oracle Fusion Projects to capture project-related asset costs and import them into Fixed Assets.
- **General Ledger:** Ensure the integration with GL through Subledger Accounting (SLA) is configured. Fixed Assets transactions (e.g., depreciation, retirement) are sent to SLA, which creates the final accounting entries that are posted to the GL.
- **Cash Management:** For asset disposals and sales, ensure the necessary cash receipts and journals are passed to Cash Management

Cash Management

Phase 1: Planning and Scoping

- **Project Kick-off and Team Formation:**
 - **Project Charter:** Create a document outlining the project's goals, scope, and stakeholders, including the project manager, functional consultants, and business SMEs from treasury and finance.
 - **Requirements Gathering:** Understand the current bank account structure, reconciliation processes (e.g., manual vs. automated), and cash forecasting needs. Document all business requirements in a Business Requirements Document (BRD).
- **Solution Design Document (SDD):**
 - Develop a blueprint for the Cash Management solution. This document will detail the bank account structure, reconciliation rules, bank statement formats, and integration points with other modules.

Phase 2: Configuration and Setup

- **Enterprise Structures:**
 - Ensure the foundational enterprise structures (Legal Entities, Ledgers) are already set up as part of the General Ledger implementation.
- **Bank, Branch, and Bank Account Setup:**
 - **Manage Banks:** Define the banks your organization uses.
 - **Manage Bank Branches:** Create the branches of each bank.
 - **Manage Bank Accounts:** This is the most critical step. Create the company's bank accounts, linking them to legal entities and ledgers. Key settings include:
 - **Currency:** The currency of the bank account.
 - **Account Use:** Specify if the account is used for Payables, Receivables, Payroll, etc.
 - **GL Account:** Link the bank account to the corresponding General Ledger cash account.
 - **Reconciliation:** Enable and set up parameters for automatic reconciliation.
- **Reconciliation Setup:**

- **Reconciliation Matching Rules:** Define rules to automatically match bank statement lines with system transactions (e.g., matching a payment on the statement to an invoice payment in Payables).
- **Transaction Codes:** Map bank statement transaction codes to internal system transaction types. This is essential for automatic reconciliation.
- **Cash Positioning and Forecasting:**
 - **Cash Positioning:** Configure cash positioning, which provides a real-time view of cash balances across all bank accounts.
 - **Cash Forecasting:** Define sources and rules for forecasting future cash flows. This can include data from Receivables (invoices), Payables (invoices), and other modules.

Phase 3: Data Migration and Integration

- **Bank Statement Integration:**
 - Work with your bank to determine the format of their bank statements (e.g., BAI2, SWIFT MT940). This is a critical technical step.
 - Set up the **Bank Statement Loader** process to automatically or manually import bank statement files into Fusion.
- **Internal Module Integration:**
 - **Payables and Receivables:** Ensure Payables payments and Receivables receipts are configured to flow into Cash Management for reconciliation.
 - **General Ledger:** Verify that all cash-related transactions from the GL are properly linked and available for reconciliation.

Budget

Phase 1: Planning and Scoping

- **Project Kick-off and Team Formation:**
 - **Project Charter:** Create a document that defines the project's goals, scope, and key stakeholders.
 - **Team:** Assemble a team including a project manager, financial consultants with expertise in Oracle GL and budgeting, and business subject matter experts (SMEs) from the finance and departmental budget owners.
- **Requirements Gathering and Business Process Analysis:**
 - **Budgeting Methodology:** Understand the organization's budgeting methodology. Is it a top-down or bottom-up approach? What is the frequency (e.g., annual, quarterly)?
 - **Control vs. Reporting:** Define the purpose of the budget. Is it primarily for financial reporting and analysis, or is it also used to enforce spending controls on transactions?

- **Budgetary Control Rules:** Document the specific rules for budgetary control, such as:
 - Which transactions should be checked for funds (e.g., requisitions, purchase orders, invoices)?
 - What is the tolerance for overspending (e.g., a certain percentage or fixed amount)?
 - Are there any exemptions?
 - **Solution Design Document (SDD):**
 - Create a detailed blueprint of the budgeting solution. This document will outline the budgetary control segment, control budgets, and reporting requirements.
-

Phase 2: Configuration and Setup

- **General Ledger Setup:**
 - **Chart of Accounts (COA):** Ensure the COA is designed to support budgeting. This often involves a specific segment (e.g., a "Budgetary Account" segment) used for budget vs. actuals reporting.
 - **Ledgers:** Confirm the primary ledger is set up correctly, as all budgetary control will be linked to it.
 - **Budgetary Control Configuration:**
 - **Control Budget:** Create a **Control Budget** to act as the container for your budget amounts. You can create multiple control budgets for different purposes (e.g., a **Corporate Budget** and a **Project Budget**).
 - **Budget Scenarios:** Define budget scenarios to capture different versions of a budget (e.g., Original Budget, Revised Budget).
 - **Budgetary Control Profile Options:** Set up profile options to enable budgetary control across various modules like General Ledger, Payables, and Procurement.
 - **Control Budget Structure:** This is a crucial setup. Define the dimension(s) on which you will enforce control. This is typically a combination of segments from your COA (e.g., Company, Department, and Account).
 - **Control Rules:** Configure the control rules, which dictate the level of control:
 - **Absolute Control:** No spending is allowed beyond the budget.
 - **Advisory Control:** A warning is issued, but spending is allowed.
 - **Control Level:** Set the level at which the budget is checked (e.g., at the fund level, fund and department level, or a combination).
-

Phase 3: Budget Data Migration and Loading

- **Budget Data Migration Strategy:**
 - Decide on the method for loading budget data. It can be a simple spreadsheet for a small organization or an automated process for a large one.
- **Data Loading Tools:**

- **File-Based Data Import (FBDI):** This is the most common tool for loading budget amounts. Use the FBDI template to prepare your budget data and then upload it to the system.
- **ADF Desktop Integrator (ADFdi):** You can also use ADFdi to enter budget amounts directly from a spreadsheet, which is useful for smaller loads or adjustments.
- **Budget Submission:**
 - Once the data is loaded, you will run a process to submit and import the budget into your control budgets. This process validates the data and populates the budget balances.

Inter Company

Phase 1: Planning and Scoping

- **Project Kick-off and Team Formation:**
 - **Project Charter:** Create a document that defines the project's goals, scope, and key stakeholders.
 - **Team:** Assemble a team including a project manager, financial consultants with expertise in Intercompany and General Ledger, and business subject matter experts (SMEs) from the finance, treasury, and accounting departments.
- **Requirements Gathering and Business Process Analysis:**
 - **"As-Is" Analysis:** Document the current process for handling intercompany transactions. Understand how transactions are initiated, approved, and settled.
 - **"To-Be" Process Design:** Design the future state business processes. This will involve defining how transactions will be initiated in various subledgers (e.g., Payables, Receivables) or directly in the General Ledger. The process should automate journal creation and reconciliation.
 - **Transaction Types:** Identify all types of intercompany transactions (e.g., corporate recharges, shared service billing, cost allocations).
- **Solution Design Document (SDD):**
 - Create a detailed blueprint of the Intercompany solution. This document will outline the setup of legal entities, balancing segments, and the specific rules for intercompany balancing and transaction processing.

Phase 2: Configuration and Setup

- **Enterprise Structures:**
 - Ensure the foundational enterprise structures (**Legal Entities, Business Units, Ledgers**) are already configured from the General Ledger implementation. The intercompany balancing segment is a critical part of the Chart of Accounts (COA) setup.
- **Intercompany System Options:**

- **General Options:** Set up global options for Intercompany, such as the maximum number of journals allowed in a batch.
 - **Invoicing:** Determine if you will use the Intercompany invoicing feature to create invoices in Payables and Receivables automatically.
 - **Intercompany Organizations and Relationships:**
 - **Intercompany Organizations:** Create and define the legal entities or business units that will transact with each other.
 - **Trading Partners:** Establish trading relationships between Intercompany organizations. This is where you define which pairs of organizations are allowed to trade.
 - **Intercompany Balancing Rules:**
 - **Balancing Segments:** Define the **balancing segment** that will be used to track intercompany transactions. This is typically a segment in your COA that represents the legal entity or company.
 - **Balancing Rules:** Configure the rules that automatically generate intercompany balancing segments for transactions that cross legal entities or balancing segments. These rules ensure that each legal entity's debits and credits are in balance.
 - **Intercompany Transaction Rules:**
 - **Transaction Types:** Define the transaction types (e.g., Corporate Recharges) that will be used.
 - **Receivables/Payables Invoicing:** Configure the rules for automatic invoice generation. This includes defining the Receivables and Payables transaction types to be used.
-

Phase 3: Data Migration and Integration

This phase involves setting up the flow of intercompany data across the system.

- **Master Data:**
 - While there isn't a large amount of master data to migrate for Intercompany itself, you must ensure that all **legal entities** and their **balancing segment values** are correctly set up and linked.
- **System Integration:**
 - **General Ledger:** The Intercompany module is tightly integrated with the GL. Transactions created in Intercompany will automatically generate journals in the GL. The system uses the **Subledger Accounting (SLA)** to create the accounting entries.
 - **Subledgers:** Ensure that subledgers like Payables and Receivables are configured to recognize and process intercompany transactions, especially for the automatic invoicing feature.
 - **Projects:** Configure the integration to allow intercompany transactions to originate from Oracle Fusion Projects.

Procurement

Phase 1: Planning and Scoping

- **Project Kick-off and Team Formation:**
 - Establish a project charter outlining the goals, scope, timeline, and key stakeholders.
 - Form the implementation team, including an executive sponsor, a project manager, functional consultants (Procurement, Financials, SCM), technical consultants, and business subject matter experts (SMEs).
- **Requirements Gathering and Business Process Analysis:**
 - Conduct workshops with business users to understand current procurement processes ("as-is" analysis).
 - Document business requirements in a Business Requirements Document (BRD). This should cover all aspects of the Procure-to-Pay (P2P) cycle, including requisitioning, purchasing, receiving, invoicing, and payment.
 - Identify and document gaps between the business requirements and Oracle Fusion's standard functionality.
- **"To-Be" Process Design and Gap Analysis:**
 - Design the future-state ("to-be") business processes, leveraging Oracle Fusion's best practices.
 - Determine how to address the identified gaps. This might involve configurations, custom workflows, or reports.
- **Solution Design Document (SDD):**
 - Create a detailed design document that outlines the proposed solution, including a system blueprint, data conversion strategy, integration approach, and reporting requirements.
 - This document serves as the blueprint for the entire implementation.

Phase 2: Configuration and Setup

- **Define Enterprise Structures:**
 - Set up the fundamental enterprise structures, which are common across all Oracle Fusion applications. This includes:
 - **Enterprise:** The highest level in the organization hierarchy.
 - **Legal Entities:** Define the legal entities that will conduct business and process transactions.
 - **Business Units:** Create and configure Business Units to handle business functions like procurement.
 - **Inventory Organizations:** Set up the organizations where items are stored.
 - **Chart of Accounts:** Define the structure for financial reporting and analysis.
- **Configure Common Procurement Components:**

- **Procurement Foundation:** Define common components used across all procurement processes, such as payment terms, freight terms, carriers, and UOM (Units of Measure) classes.
- **Setup of Suppliers:** Configure supplier data management, including supplier profiles, addresses, contacts, and bank accounts.
- **Purchasing Categories:** Define the category hierarchy for organizing and classifying goods and services.
- **Configure Procurement Modules:**
 - **Purchasing:** Configure purchasing document types (Requisitions, Purchase Orders, Agreements), document numbering, and security rules.
 - **Self Service Procurement:** Set up requisitioning, catalogs, content zones, and the responsive user interface.
 - **Supplier Portal:** Configure the supplier-facing portal for managing profile information, orders, shipments, and invoices.
 - **Sourcing:** Define negotiation styles, templates, and rules for managing supplier negotiations.
 - **Supplier Qualification Management:** Configure questionnaires and qualification areas to assess and qualify suppliers.
 - **Procurement Contracts:** Set up the contract terms library, clauses, and templates.

Phase 3: Data Migration and Integration

- **Data Migration Strategy:**
 - Develop a strategy for migrating master data (suppliers, items, etc.) and open transactional data (open requisitions, purchase orders).
 - Identify the source systems and the data to be migrated.
 - Use Oracle's provided tools, such as File-Based Data Import (FBDI) and REST APIs, for data loading.
- **System Integration:**
 - Identify and design integrations with other systems, such as your financial system (for invoices and payments), inventory system, or external supplier catalogs.
 - Use Oracle Integration Cloud (OIC) or other integration platforms to build and manage these connections.

Inventory Management Configuration and Setup

Step 1: Define Foundational Structures

- **Enterprise:** This is the top-level structure.
- **Legal Entities:** These represent the legal companies within your enterprise.
- **Business Units:** A business unit is the container for business functions, such as procurement or sales. You'll link inventory organizations to business units.
- **Ledgers:** You must have a primary ledger to manage financial transactions.

Step 2: Set Up Inventory Organizations

- **Create Inventory Organization:** Go to the Functional Setup Manager (FSM) and search for the **Manage Inventory Organization** task.
- **Assign Business Unit:** Link the inventory organization to a specific business unit to enable it for business functions like procurement and sales.
- **Assign Legal Entity:** Associate the inventory organization with a legal entity. This is vital for financial and tax reporting.
- **Define Accounting Information:** Set up the accounting information for the organization, including cost, valuation, and expense accounts that will be used for inventory transactions.
- **Define Inventory Parameters:** Set up key parameters that control inventory behavior within the organization. This includes settings for:
 - **Costing Method:** Select a costing method like Standard, Average, or FIFO.
 - **Transaction Processing:** Define how transactions are handled (e.g., immediate, deferred).
 - **Material Status:** Set up statuses to control an item's usability (e.g., Active, Hold, Inactive).

Step 3: Configure Inventory-Specific Components

- **Subinventories:** A subinventory is a physical or logical subdivision of an inventory organization. It represents a storage area, such as a warehouse, a production floor, or a shipping dock. You need to define subinventories to track inventory accurately.
- **Locators:** A locator is a specific storage space within a subinventory (e.g., a row, aisle, bin). Locators provide the most granular level of inventory tracking.
- **Units of Measure (UOM):** Define the units in which items are bought, sold, and stored (e.g., Each, Carton, Kilogram). You will set up UOM classes and then define the UOMs within those classes.
- **Item Categories and Catalogs:** Group similar items into **categories** and organize them into **catalogs**. This helps with searching, reporting, and managing item data.

- **Transaction Types:** Configure transaction types to control the movement of items, such as material transfers, miscellaneous receipts, and issues.
- **Item Statuses:** Define the statuses that control what can be done with an item. This ensures items are only used for their intended purpose.

Step 4: Manage Items

- **Create Items:** Use the **Manage Items** task to create new items. When creating an item, you'll need to:
 - **Assign to Inventory Organization:** Link the item to the inventory organization where it will be used.
 - **Define Item Attributes:** Configure attributes such as `Purchased`, `Stocked`, `Inventory Item`, and `Shippable` to control the item's behavior in different modules.
 - **Assign to Categories:** Assign the item to the appropriate categories for reporting and management.
- **Item Relationships:** If needed, you can define relationships between items, such as cross-references, substitutes, or related items.

Step 5: Load On-Hand Balances

- **Use FBDI:** The most common and recommended method for bulk loading is using a **File-Based Data Import (FBDI)** spreadsheet. This template allows you to populate on-hand quantities for multiple items in various subinventories and locators.
- **Manual Entry:** For a small number of items, you can use the **Miscellaneous Receipt** transaction to manually add quantities to a specific subinventory.

Order Management Configuration and Setup

Step 1: Define Foundational Structures

- **Enterprise Structures:** Confirm that your **Legal Entities**, **Business Units**, and **Ledgers** are defined. Order management will be linked to a specific business unit.
 - **Inventory Organizations:** Ensure that the **Inventory Organizations** where items will be sourced from are set up and that the items themselves are defined with the appropriate attributes.
 - **Customer Master:** Customers and their site locations must be configured in the system.
-

Step 2: Configure Order Management-Specific Components

- **Order Management Parameters:** Set up global parameters that govern the behavior of the Order Management application. This includes defaults for order entry, pricing, and fulfillment.
 - **Order Types:** Define different types of sales orders based on your business needs (e.g., Standard Sales Order, Return Order, Drop Ship Order).
 - **Fulfillment Lines:** Configure settings for fulfillment lines, which represent the individual items on an order. You can set up fulfillment lines to be fulfilled from a specific inventory organization.
 - **Pricing:** The pricing setup is critical. You'll need to define:
 - **Price Lists:** Create price lists that contain the prices for your items. A price list is a collection of prices for different items.
 - **Pricing Rules and Tiers:** Set up rules to apply discounts, surcharges, and tiers based on factors like customer type, order quantity, or date.
 - **Shipping:** Configure shipping parameters to manage the logistics of order fulfillment:
 - **Shipping Methods:** Define the various shipping methods your company uses (e.g., Ground, Air, Express).
 - **Freight Terms:** Set up freight terms to determine who is responsible for paying shipping costs (e.g., Prepaid, Collect).
 - **Approval Rules:** Design and configure the approval workflows for sales orders. You can set up rules based on the order amount, customer, or other attributes that require a manager's approval before the order can be processed.
-

Step 3: Configure Order Fulfillment

- **Sourcing Rules:** **Sourcing Rules** are crucial for determining where an item should be sourced from. You can define rules to source an item from a specific inventory organization or supplier.
 - **Fulfillment Orchestration:** This is the core of Order Management. **Orchestration** manages the end-to-end lifecycle of a sales order. You'll need to:
 - **Define Orchestration Process:** Set up the steps in the order fulfillment process (e.g., Await Scheduling, Await Shipping, Await Invoicing).
 - **Assign Orchestration Process:** Assign the appropriate orchestration process to each order type.
-

Step 4: Data Migration and Integration

- **Customer and Item Data:** Ensure that all customer and item master data is loaded and validated.
 - **Open Order Data:** Decide whether to migrate open sales orders from your legacy system. This is a crucial cutover decision.
 - **Integration with Other Modules:**
 - **Inventory Management:** Order Management is tightly integrated with Inventory Management to reserve and ship items.
 - **Receivables:** The system will automatically create invoices in Receivables once an order has been shipped.
 - **Financials:** The transactions will flow to the General Ledger for financial reporting.
-

Step 5: Testing and Deployment

- **System Integration Testing (SIT):** Perform end-to-end testing of the entire Order-to-Cash cycle.
 1. Create a sales order.
 2. Verify that pricing rules are applied correctly.
 3. Confirm that the order is fulfilled from the correct inventory location.
 4. Verify that shipping and invoicing are processed correctly.
- **User Acceptance Testing (UAT):** Business users will perform UAT to ensure the solution meets all their business requirements.
- **Go-Live:** Once UAT is successful, you can deploy the solution and begin live operations.
