# Sales Order Back-to-Back (Make)

## Documentation

A company manufactures a finished product (**FG-101: Widget A**) using **Discrete Manufacturing** in Oracle Fusion. The item is configured for **Back-to-Back (Make)** supply, meaning a **Work Order is automatically triggered when a Sales Order is booked**, to fulfill that exact demand. The product has a detailed **Work Definition**, including raw materials, operations and resources.

### Prerequisites

- Inventory Setup
- Order Management Setup (Customer – Pricing – Order Management Parameters)
- Manufacturing Setup (Plant Parameters – Work Area – Work Center – Resources) ([Check for Reference](#))

### Creating RAW Items and Miscellaneous transactions.

we create raw materials required to manufacture the finished product, and also perform miscellaneous inventory transactions to ensure on-hands quantity for work order

The screenshot displays the 'Item Quantities' page in Oracle Vision for organization YO1. The table below shows the raw materials (RM) configured for the finished product.

| Item                                | Organization | Ownership | Control | On Hand | Receiving | Inbound | UOM | Available to Reserve | Available to Transact |
|-------------------------------------|--------------|-----------|---------|---------|-----------|---------|-----|----------------------|-----------------------|
| <input type="checkbox"/> RM-ALUM01  | YO1          | Owned     |         | 10,000  |           |         | Ea  | 10,000               | 10,000                |
| <input type="checkbox"/> RM-BOX01   | YO1          | Owned     |         | 10,000  |           |         | Ea  | 10,000               | 10,000                |
| <input type="checkbox"/> RM-SCREW04 | YO1          | Owned     |         | 10,000  |           |         | Ea  | 10,000               | 10,000                |

# Creating Output Item with Back-to-Back enabled.

We define the finished good item (FG-101) and enable the **Back-to-Back** supply option.

## Work Definition for Output Item FG-101

Here, we define the complete **Work Definition** for FG-101. This includes the operations associated resources (machines/labor), and required raw materials. This structure enables Oracle Fusion to automatically create and schedule manufacturing activities.

# Cost Scenario for Work Definition (Output)

This section captures the cost structure of FG-101. We define the **Standard Cost** for materials, resources, and overhead. This will later be used in **Cost Accounting** to evaluate production cost and calculate variances.

## Define Planning Source System

In this step, we ensure our **Inventory Organizations** are added under the **Operational Planning System (OPS)**. This ensures GOP (Global Order Promising) has access to accurate supply and availability data from the correct orgs.

# Create ATP Rule

We define **Available-to-Promise** rules, which control how supply and demand are matched in the system. These rules determine if on-hand, planned orders, or new make-to-order supply can fulfill the Sales Order.

# Creating Sourcing Rule

## Creating Global Sourcing Rule for Item

**Global sourcing** rule defines from which inventory organization an item will be sourced during order creation and booking (Shipping the item).

### Specify details for the Sourcing Global Rule:

- **Inventory Organization:** Define which inventory (e.g., YO1) will source the items.
- **Allocation:** Specify the allocation percentage (e.g., 100%).
- **Priority:** Define priorities in case of multiple sourcing rules (e.g., priority 1: 001, priority 2: 002).
- **If applicable, specify "Buy from Supplier" for drop shipment scenarios.**

## Creating Local Sourcing for Back-to-Back from YO1

**Local Sourcing rule** for the inventory that will ship the item so we define for which type will use (Supply from supplier or Transfer from the inventory or Make at Plant) to fulfill the item at Inventory.

Specify details for **the sourcing Local for the inventory YO1** that will ship the item mentioned in the Global rule Back-to-Back (Buy / Transfer / Make).

- **Transfer from:** to create transfer order from another inventory in case there's no on-hand quantity.
- **Supply from:** to create pr>po to receive the items into inventory in case there's no on-hand quantity.
- **Make at:** to create a work order through the work definitions that previously defined for the Item

## Assigning Sourcing Rule to Item and Inventory

- Make sure which assignment set assigned to order promising (Default: GlobalOrderPromising)
- Navigate to Global Order Promising > Assignment Sets.
- Select the default assignment set (e.g., "Global Order Promising Assignment Set").
- Specify the item and associate it with the created sourcing rule.

## Refreshing the GOP Engine

Refreshing the GOP Engine ensures the latest item data, sourcing rules, and planning setups are active and synchronized. Without this step, GOP might not trigger the desired Back-to-Back behavior.

## Check Item Availability

In this step, we check the on-hand availability of the item (FG-101). The system detects a **partial quantity available in inventory** and uses it to fulfill part of the Sales Order.

The **remaining quantity**, which cannot be fulfilled from stock, is automatically sourced via **Back-to-Back (Make)** logic — triggering a Work Order based on the sourcing rule.

# Close Work Order

Once manufacturing is complete, we close the work order to finalize production. At this stage, all transactions—material issue, labor, and resource usage—are recorded and ready for costing.

## Create Costing Distrubutions

In this final step, we generate **cost distributions** to record the financial impact of production. This includes material cost, labor, and overheads. These values flow into inventory valuation and financial reporting.

# Min-Max Planning (Make)

## Documentation

A company manufactures a finished product (**FG-101: Widget A**) using **Discrete Manufacturing** in Oracle Fusion. The item is set up for **Min-Max Planning (Make)**, meaning the system will automatically generate work orders when inventory falls below a minimum threshold. The item has a complete **Work Definition**, including **operations, resources, and raw materials**.

### Prerequisites

- Inventory Setup
- Manufacturing Setup (Plant Parameters – Work Area – Work Center – Resources) ([Check for Reference](#))

### Creating RAW Items and Output Item with Min-Max Activation

In this step, we create both raw materials and the finished good item (FG-101) required for the manufacturing process. **For the finished item**, we activate **Min-Max Planning (Make)** at the organization level. This setup ensures the system will automatically generate work orders when inventory levels drop below the defined minimum.

The screenshot displays the 'Item Organization: Planning' page in Oracle Fusion. The left navigation pane shows the 'Planning' tab selected under the 'Item' section. The main content area is divided into several sections:

- General Planning:** Includes 'Inventory Planning Method' set to 'Min-max planning' and 'Make or Buy' set to 'Make'.
- Min-Max Quantity:** Includes 'Minimum' set to 50 and 'Maximum' set to 100.
- Cost:** Includes 'Order' and 'Carrying Percentage' set to 70.
- Source:** Includes 'Replenishment Type' set to 'Organization'.

Other visible fields include 'Planner', 'Subcontracting Component', 'Order Quantity', 'Minimum', 'Maximum', 'Organization', and 'Subinventory'.

## ABDELRAHMAN YOUNIS

Make sure that we have enough on hand quantity of RAW Materials for work order.

## Print min max @ organization level (make Restock = yes)

We run the **Min-Max Planning Report** with "Make Restock" enabled. This report checks on-hand quantities and identifies if inventory levels have dropped below the minimum threshold. If so, it triggers a replenishment request via **Supply Chain Orchestration**.

The screenshot shows the 'Schedule New Process' dialog box. The 'Type' is set to 'Job'. The 'Name' is 'Print Min-Max Planning Report'. The 'Description' is 'Calculates min-max planning replenishment levels for items.' The 'OK' button is highlighted with a red box.

The screenshot shows the 'Process Details' dialog box. The 'Name' is 'Print Min-Max Planning Report'. The 'Description' is 'Calculates min-max planning replenishment level...'. The 'Schedule' is 'As soon as possible'. The 'Submission Notes' field is empty. The 'Basic Options' section is expanded, showing parameters: Organization (YO1), Sort By (Inventory item), From Item, To Item, Planning Level (Organization), Item Selection (All min-max planned items), Subinventory, Batch Prefix, Lot Control (Include both lot and not lot controlled items), Demand Cutoff Date (dd-mmm-yyyy), and Demand Cutoff Date Offset. The 'OK' button is highlighted with a red box.

## Create process supply chain interface to generate Work order

Using the **Process Supply Chain Interface**, we convert the planning output from the Min-Max report into a formal **Work Order**. This step bridges planning with execution and initiates production within the manufacturing module.

The screenshot shows the 'Schedule New Process' dialog box. The 'Type' is set to 'Job'. The 'Name' field contains 'Process Supply Chain Orchestration Interface'. The 'Description' field contains 'Creates supply orders based on Supply Chain Orchestration Interface records'. The 'OK' and 'Cancel' buttons are at the bottom right.

The screenshot shows the 'Process Details' window. The 'Name' field contains 'Process Supply Chain Orchestration Interface'. The 'Description' field contains 'Creates supply orders based on Supply Chain Orchestration Interface records'. The 'Schedule' is set to 'As soon as possible'. The 'Submission Notes' field is empty. The 'Basic Options' section is expanded, showing the 'Parameters' section. The 'Supply Request System' is set to 'Oracle Fusion Inventory Management'. The 'Organization' field is empty. The 'From Supply Request Batch Number' field is empty. The 'To Supply Request Batch Number' field is empty. The 'From Supply Request Date' field is set to 'dd-mmm-yyyy hh:mm a'. The 'To Supply Request Date' field is set to 'dd-mmm-yyyy hh:mm a'. The 'Batch Size' field is empty. The 'Submit' button is highlighted with a red box.

## Check Supply Orchestration for Work Order

In this step, we verify that the supply orchestration process has successfully created and processed a new **Work Order**. This is an essential checkpoint to confirm that planning data has been properly consumed and acted upon using Batch Number Processed.
